# Remote Control

midi-keyboard, midi-piano, electronic sounds

for Moena Katsufuji

Simon Bahr 2022

## **Preface**

### About the piece

Remote Control is an invitation for the performer to switch back and forth between performing and listening: All 49 keys of a midi-keyboard trigger sounds, projected by a midi-piano and a loudspeaker. In different parts of the piece, these mini-compositions are used as note-like musical events or are simply listened to one by one. In the latter case, the performer becomes a listener, using the midi-keyboard as a remote control for switching channels whenever she starts to be bored...

#### **Notes on Performance**

Accidentals apply for the rest of the respective bar.

C#2 has no sound in the beginning. This is on purpose. In the beginning of the piece, there should be no sound at all on C#2. Play it very short. It should leave the impression that the keyboard is not working. Later in the piece (bar 100), C#2 occurs longer. It should be played with an exaggerated gesture.

ad. lib.

Play the sequence of notes in order. You may choose any duration for each note – including very, very short – but you should stop when there is no sound coming from midi-piano or loudspeaker anymore. You can prepare approximate durations for each note in advance in order to create your favorite version of the piece: Only let those sounds happen here that you like and want too hear!

until silence

Hold the note until there is no sound coming from midi-piano or loudspeaker anymore. Do not stop earlier.

#### **PD-Patch**

A Pure Data patch is provided. It triggers one wave-file and one midi-file for each key pressed on the midi-keyboard. Additionally, the patch scales velocity and volume, applying some filtering and reverb to the soundfiles in order to make volume-changes sound more natural. All of this can also be achieved using other software.

#### ad lib. (hold notes max. until silence)
